Let's Kill Cancer

AI-Supported Clinical Assessment

Report ID	#19
Assessment Date	Feb 19, 2026
Generated	Feb 19, 2026 at 16:44
Doctor	kelvin
Department	Oncology

PATIENT DETAILS

PATIENT	DATE OF BIRTH	GENDER
[NAME]	[DOB]	[GENDER]

MRN	PHONE	EMAIL
[ID]	[PHONE]	N/A

SPECIMEN INFORMATION

SPECIMEN TYPE	CONFIDENCE BASIS
Biopsy	Biopsy Feature Patterns

CLINICAL INDICATION

[Brief reason for test]

AI PREDICTION RESULT

MALIGNANT RISK — HIGH

84.3%

Malignancy Probability Score: **84.3%** Threshold: **>70% = High Risk**

Model Output: Higher Pattern Concern

FEATURE ANALYSIS

FEATURE	SCORE	MAX SCORE	RISK LEVEL	CLINICAL INTERPRETATION
Edge	3	5	Moderate	Border irregularity is present and should be correlated with imaging.
Size	4	5	High	Larger lesion dimension increases suspicion for malignant behavior.
Shape	2	5	Low-Moderate	Shape distortion is limited but should be tracked with morphology changes.
Texture	5	5	Very High	Marked heterogeneity strongly supports high-risk tissue patterning.
Complexity	3	5	Moderate	Intermediate structural complexity warrants expedited specialist review.

CLINICAL INTERPRETATION

The AI model identifies a high-risk malignant pattern based on biopsy morphology, with dominant contributions from texture and lesion size features.

Clinical correlation with patient history, staging investigations, and multidisciplinary review is recommended before definitive treatment planning.

RECOMMENDATIONS

1. Review findings in context of prior history and current symptom profile.
2. Present this case at a multidisciplinary tumor board review.
3. Schedule staging CT scan and oncology referral within 7 days.
